-!- FUNCTION: The vacuolar ATPase is responsible for acidifying a variety of intracellular compartments in eukaryotic cells. This subunit is essential for its assembly or catalytic function. VATPase is responsible for energizing electrophoretic K+/2H+

Microbiol. 49:1577-1593(2003).
-!- FUNCTION: Involved in DNA repair (By similarity).
-!- SIMILARITY: Belongs to the radC family.
                                                                                                          Bacteria; Firmicutes; Bacillales; Staphylococcus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        226 AA.

-!- FUNCTION: May play a role in plant defense. Has probably no oxafate oxidase activity even if the active site is conserved.
-!- SUBUNIT: Oligomer (believed to be a pentamer but probably hexamer) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    POTENTIAL.

-! FUNCTION: The proteasome is a multicatalytic proteinage complex which is characterized by its ability to cleave peptides with Arg, Phe, Tyr, Leu, and Glu adjacent to the leaving group at neutral or slightly basic pH. The proteasome has an ATP-dependent proteolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBUNIT: The protessome is composed of at least 15 non identical subunits which form a highly ordered ring-shaped structure (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBCELLULÂR LOCATION: Cytoplasmic and nuclear (By similarity). SIMILARITY: Belongs to peptidase family T1B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               activity.

                                                                                                                                                                                cyanobacterium Anabaena sp. strain PCC 7120.";

DNA Res. 8:205-213(2001).

-!- FUNCTION: Part of the ABC transporter complex pstSACB
(TC 3.A.1.7.1) involved in phosphate import. Responsible for energy coupling to the transport system (By similarity).

-!- CATALYTIC ACTIVITY: ATP + H(2)O + phosphate(Out) = ADP + phosphate

    + phosphate(In).
    -!- SUBUNT: The complex is composed of two ATP-binding proteins (pstB), two transmembrane proteins (pstC and pstA) and a solute-binding protein (pstS) (Probable).
    -!- SUBCELLUIAR LOCATION: Inner membrane-associated (By similarity).
    -!- SIMILARITY: Belongs to the ABC transporter family. PstB subfamily.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PROSITE; PS00211; ABC_TRANSPORTER_1; 1.

"Multiple forms of mouse 3 beta-hydroxysteroid dehydrogenase/delta 5-
delta 4 isomerase and differential expression in gonads, adrenal
glands, liver, and kidneys of both sexes.",
Proc. Natl. Acad. Sci. U.S.A. 88:8870-8874(1991).
-!-FONCTION: 3beta-HSD is a bifunctional enzyme, that catalyzes the
cxidative conversion of delta(5)-ene-3-beta-hydroxy steroid, and
the oxidative conversion of ketosteroids. The 3beta-HSD enzymatic
system plays a crucial role in the biosynthesis of all classes of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota, Viridiplantae, Streptohyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; rosids; eurosids II; Brassicales; Brassicaceae; Arabidopsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                May B.J., Zhang Q., Li L.L., Pauetian M.L., Whittam T.S., Kapur V.;
"Complete genomic sequence of Pateturella multocida Pm70.";
Proc. Natl. Acad. Sci. U.S.A. 98:3460-3465(2001)
-I. CATALYTIC ACTIVITY: Myo-inositol 1-phosphate + H(2)0 = myo-inositol 4-phosphate.
-I. COPACTOR: Magnesium (By similarity).
-I. COPACTOR: Magnesium (By similarity).
-I. SIMILARITY: Belongs to the inositol monophosphatase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

Biol. Chem. 269:29346(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PROCEEDING AMPK TERRONGELE FOR THE REGULATION OF PATTY ACID SYNTHESIS BY PHOSPHORYLATION OF ACETYL-COA CARBOXYLASE. ALSO REGULATES CHOLESTEROL SYNTHESIS OF A PHOSPHORYLATION AND REGULATES CHOLESTEROL SYNTHESIS OF A PHOSPHORYLATION AND RACTIVATION AND INACTIVATION OF HYDROXYRETHYLGILUTAXYL-COA REDUCTASE AND HORWONE-SENSITIVE LIPASE. THIS IS A REGULATORY SUBUNIT, MAY BE A POSITIVE RECULATOR OF AMPK ACTIVITY. IT MAY ALSO SERVE AS AN ADAPTER WOLECULE FOR THE CATALITY: IT MAY ALSO SERVE AS AN ADAPTER TESURE SPECIFICITY: Highly expressed in kidney, heart, white adipose tissue, lung and spleen.

-!- TISSUE SPECIFICITY: Highly expressed in kidney, heart, white adipose tissue, lung and spleen.
-!- FTM: Phosphorylated when associated with the catalytic subunit.
-!- STHILARLIFY: Belongs to the 5'-AMP-activated protein kinase beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Warden S.M., Richardson C., O'Donnell J. "Genome sequence of Vibrio parahaemolyticus: a pathogenic mechanism

RI distinct from that of V. cholerae.";

RI Lancet 361:743-749(2003).

C. - FUNCTION: Redox regulated molecular chaperone. Protects both

thermally unfolding and oxidatively damaged proteins from

irreversible aggregation. Plays an important role in the bacterial

CC thermally unfolding and oxidative stress (By similarity).

CC -- PTM: Under oxidizing conditions two disulfide bonds are formed

CC involving the reactive cysteines. Under reducing conditions zinc

important to the reactive cysteines and the protein is inactive (By
                                                                                                                                                                                                                                                                                                                                                                           ô

Submitted (DEC-2002) to the EMBL/GenBank/DDBJ databases.
-- FWOTION: Redox regulated molecular chaperone. Protects both thermally unfolding and oxidatively damaged proteins from irreversible aggregation. Plays an important role in the bacterial defense system toward oxidatively stress (By similarity).
-- SUBCELLULAR LOCATION: Cytoplssmic (By similarity).
-- PTM: Under oxidizing conditions two disulfide bonds are formed involving the reactive cysteines. Under reducing conditions zinc is bound to the reactive cysteines and the protein is inactive (By

"Complete genome sequence of a virulent isolate of Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Science 293:498-506(2001).
-!- FUNCTION: Responsible for synthesis of pseudouridine from uracil-55 in the psi GC loop of transfer RNAs (By similarity).
-!- CATALYTIC ACTIVITY: Uracil + D-ribose 5-phosphate = pseudouridine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- SIMILARITY: Belongs to the pseudouridine synthase truB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               097033;

                                                                                                                                                                                                   1. Steroid Biochem. Mol. Biol. 52:35-44(1995).

1. Steroid Biochem. Mol. Biol. 52:35-44(1995).

1. FUNCTION: Sulfation of estrone and estradiol. May control the level of the estrogen receptor by sulfate + estrone = denosine 3',5'-bisphosphate + estrone 3-sulfate.

2. SUBGUIT: Homodimer (By similarity).

3. SUBGRILIT: Homodimer (By similarity).

3. SUBGRILIT: Homodimer (By similarity).

4. SUBGRILITS LOCATION: Cytoplasmic.

4. DEVELOWENTAL STAGE: Expressed only in the liver of young adult animals (100 days old) and is absent in the prepubertal male (27 days old), senescent male (800 days old) and female liver.

5. INDUCTION: Induced by androgens and suppressed by estrogens. The expression is under the influence of pituitary growth hormone and thyroid hormone. Is regulated by progesterone in the uterus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

         J. Steroid Biochem. Mol. Biol. 52:35-44(1995).

-!- FUNCTION: Sulfation of estrone and estradiol. May control the level of the estrogen receptor by sulfurylating free estradiol.

-!- CATALYTIC ACTIVITY: 3' - phosphoadenylyIsulfate + estrone = adenosine 3', 5' - bisphosphate + estrone 3 - sulfate.

-!- SUBUNIT: Homodimer (By similarity).
-!- SUBCELULIAR LOCATION: Cytoplasmic.
-!- DEVELOPMENTAL STAGE: Expressed in males rats, but not in females.
-!- INDUCTION: Induced by androgens and suppressed by estrogens.
Expression is under the influence of pituitary growth hormone and

"Complete genomic sequence of Pasteurella multocida Pm70.";
Proc. Natl. Acad. Sci. U.S.A. 98:3460-3465(2001).
"Complete Steepering and rejoining of the recombining DNA molecules. The xerc.xerb complex is essential to convert dimers of the bacterial chromosome into monomers to permit their segregation at cell division. It also contributes to the segregational stability of plasmids (By similarity).

-!- SUBUNIT: Forms a cyclic heterotetrameric complex composed of two molecules of xerC and two molecules of xerD (By similarity).

-!- SUBCLIDIAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: Belongs to the "phage" integrase family. XerC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. I. Bacteriol. 184:2005-2018(2002). The monopyrrole PBG into the hydroxymethylbilane preuroprophyrinogen in several discrete steps.

C. -! FUNCTION: Tetrapolymerization of the monopyrrole PBG into the hydroxymethylbilane preuroprophyrinogen in several discrete steps.

C. -! CATALYTIC ACTIVITY: 4 porphobilinogen in several discrete steps.

C. -! CATALYTIC ACTIVITY: 4 porphobilinogen a dipyrromethane cofactor to which the porphobilinogen subunits are added (By similarity).

C. -! PATHWAY: Porphyrin blosynthesis by the C5 pathway; fourth step.

"Evidence for the Heterolobosea from phylogenetic analysis of genes
encoding glyceraledryde-3-phosphate dehydrogenase.";

J. Bukaryot. Microbiol. 43:475-485(1996).

-!- CATALYITC ACTIVITY: D-glyceraldehyde 3-phosphate + phosphate +
-!- PATHWAY Second phase of glycolygis;
-!- PATHWAY Second phase of glycolygis;
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SUMILARITY: Belongs to the glyceraldehyde 3-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                       J. Bacteriol, 172:4510-4521(1990).

-!- FUNCTION: Required for transport of secretory proteins from the Golgi complex. Catalyzes the transfer of phosphatidylinositol and phosphatidylcholine between membranes in vitro (By similarity).

-!- SUBCELULLAR LOCATION: Associated with the Golgi complex as a peripheral membrane protein (By similarity).

-!- SIMILARITY: Contains 1 CRAL-TRIO domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Complete sequence analysis of the genome of the bacterium Mycoplasma

Incrobacillus confusus at 2.2-A resolution. An example of strong

T asymmetry between subunits.";

J Mol. Biol. 251:256-281(195).

- !- FUNCTION: Catalyzes the NADP dependent reversible and strencespecific interconversion between 2-ketcoarboxylic acids and 1-2-hydroxy-carboxylic acids.

- SUBUNIT: Homotertamer.

- I SUBUNIT: Homotertamer.

- MISCELLANEOUS: Can be applied in an industrial process for the production of L-amino acid.

- SUMILARITY: Belongs to the LDH family.

Crenarchaeon, Sulfolobus tokodaii strain7.";
DNA Res. 8:123-140(2001).
-!- FUNCTION: Catalyzes the NAD-dependent oxidative cleavage of
spermidine and the subsequent transfer of the butylamine moiety of
spermidine to the epsilon-amino group of a specific lysine residue
of the eIF-5A precursor protein to form the intermediate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STRAIN=JCM 10545 / 7;

Proc. Natl. Acad. Sci. U.S.A. 98.7835-7840(2001).
I. Proxyacetone phosphate to form quinolinate (By similarity).
C. -- PATHWAY: NAD biosynthesis; aspartate to NaW; second step.
C. -- STHILAMILY: Belongs to the quinolinate synthetase A family.
C. -- STHILAMILY: Subbongs to the quinolinate synthetase A family.

deoxyhypusine residue (By similarity).
-!- CATALYTIC ACTIVITY: [eIF5A-precursor]-lysine + spermidine |
-!- CEFFA-precursor]-deoxyhypusine + propane-1,3-diamine.
-!- COFACTOR: NAD (By similarity).
-!- PATHWAY: Hypusine biosynthesis; first step.
-!- SIMILARITY: Belongs to the deoxyhypusine synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pfam; PF01916; DS; 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hydroxymethylbilane preuroporphyrinogen in several discrete steps.
-!-CATALYTIC ACTIVITY: 4 porphobilinogen + H(2)0 = hydroxymethylbilane + 4 NH(3).
-!-COPACTOR: Covalently binds a dipyrromethane cofactor to which the porphobilinogen subunits are added (By similarity).
-!-PATHWAY: Porphyrin biosynthesis by the C5 pathway; fourth step.
-!-SUBUNIT: Monomer (By similarity).
-!-SUBUNIT: Belongs to the HMBS family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pfam; Proise,
